Look at What You've Been Feeding - Me Data Harvesting Your CMMS/EAM

You've been collecting data from work orders, purchasing, and inventory transactions in your Computerized Maintenance Management System (CMMS) or Enterprise Asset Management (EAM) now what? Sadly most organizations never look back at this data and utilize it to optimize their reliability programs, predict potential failures before they happen, or just understand the maintenance trends from their own assets in their own environment. Dare I say this could be the "crystal ball" you've been looking for or that maintenance fortune teller you've wanted on staff? The answers are normally found within the data, with maintenance being the repetitive business it is, it only makes sense to look and see what's coming next not to wait for it to happen.
